Project: Learn about system for music playback

- Write a program to play music
- Prepare 4 preset music tracks

From the requirements:

1. Present menu for user to choose track
2. Play the track chosen
3. Make it able to stop playback when user press “0”

Solutions:

1. User inputs are simple → Use Hexadecimal Keypad with interrupts to handle inputs
2. Inputs received for Keypad are in odd form (column-row in 2 nibbles) → use `lookup_table` to translate intention (load proper song address)
3. Use `s1` like a flag for “0” press to be able to stop the playback
